                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                 A method for the analysis of cDNA comprises (a) preparing an aggregate (double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEQ files AAO75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEQ files AAO75547-0775798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Analysis of cDNA and gene expression - by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               04-AUG-1995

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences represented by, AAQ90402-15 are synthetic DNA probes containing 5' amino termini. The sequences shown in AAQ90390-401 are synthetic DNA probes with 3' ribonucleoside termini. These sequences were specific for the polymorphisms of HLA gene dQa. The sequences were used in the device of the invention. This is a self-addressable electronic device (SAED) that can be used to carry out multi-step and multiplex reactions, such as nucleic acid hybridisations. The advantages of this method are that these reactions can be carried out with complete and precise electronic control, and that the rate, specificity and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Stem cell factor; progenitor; haematopoiesis; SCF; anaemia; thrombocytopenia; leucopenia; AIDS; immunodeficiency; bone graft; transplant; neoplasia; myelosuppression; bone marrow; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New self-addressable electronic devices - used for multi-step and multiplex reactions such as DNA hybridisation(s), clinical diagnostics and bio:polymer synthesis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAT04915-T04922 are oligonucleotide primers and probes used for the CC amplification and sequencing of mammalian stem cell factor (SCF). Non-cc naturally occurring SCF and C-terminally truncated polypeptides, having CC amino acid sequences sufficiently duplicative of naturally ocurring SCF, cc stimulate growth of primitive progenitors such as haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The progenites can be used in a composition for treating leucopenia, anaemia or transplantation or for bone marrow recovery after chemotherapy or cc radiation-induced bone marrow aplasia or myelosuppression. They can also be used for treating neoplasia, nerve damage, intertility, intestinal cd damage or myeloproliferative disorders. Antibodies may be raised against the peptides for use in detection or neutralisation of SCF in serum. SCF cmay be useful for the treatment of AIDS and severe combined communodeficiency (SCI) states alone or in combination with other factors such as IL-7. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAT04915-T04922 are oligonuclectide primers and probes used for the campilification and sequencing of mammalian stem cell factor (SCF). Non-comparison of mammalian stem cell factor (SCF). Non-comparison acid sequences sufficiently duplicative of naturally occurring SCF, stimulate growth of primitive progenitors such as haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The composition for treating leucopenia, anaemia or thrombocytopenia, for enhancing engraftment of bone marrow during transplantation or for bone marrow recovery after chemotherapy or radiation-induced bone marrow aplasia or myelosuppression. They can also be used for treating neoplasia, nerve damage, infertility, intestinal damage or myeloproliferative disorders. Antibodies may be raised against the peptides for use in detection or neutralisation of SCF in serum. SCF may be useful for the treatment of AIDS and severe combined composition of SCID) states alone or in combination with other factors such as IL-7. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The present sequence represents a primer used in an example in the present invention describing corn barnacle G-protein binding receptor secondary gene. Corn barnacles, which attach themselves to the bottoms of ships, wharfs and drainage, cause serious damage in industry. The corn barnacle G-protein binding receptor secondary gene, which is involved in the mechanisms of such attachment, can be used to develop a protection against corn barnacle attachment. The invention comprises isolating and
                                                                                                                                                             Corn barnacle G-protein binding develop protection against corn ships, wharf(s) and drainage.
                                                                                                                                Example 1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match
                                                                                                                                                           oligonucleotides having a partial sequence consisting of at least 15 bases of AAT63641 (an antieense oligo complementary to a region of the tax gene which can inhibit human T-cell lymphotropic virus type 1 (HTLV-1) viral antigen expression) are claimed. In an example, six antieense oligos were designed, T1-T6 (AAT63650-55) and were compared to six oligos derived from other regions of HTLV-1, i.e. SJI (splice junction), P1 (p21), R1 (rex), RR1 (rex response element), E1 (env) and G1 (gag), four reference oligonucleotides TIS (tax-sense), HC (dC20), HT (dT20) (AAT63647-49) and a random 20mer (RAN) in a HTLV-1 virus antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cloning DNA from the corn barnacle Balanus amphitrite, and inserting it into a vector. Host microorganisms are transformed with the vector to give a DNA library, from which a positive clone is selected using a colony hybridisation probe, and target gene selection from the positive clone using Southern hybridisation. E. coli JM109 carrying the plasmid pUC-BAR2, which contains the corn barnale G-protein binding receptor secondary gene, has been deposited as FERM P-15509 with the National Institute of Bioscience and Human Technology, Agency of Industrial

                                                                                                                                                                                                                                                                                                                                                                                                                                 This oligonucleotide is used in the DNA cloning strategies of the Mycobacterium vaccae antigens. The invention provides M. vaccae polypeptides that comprise an immunogenic portion of a soluble M. vaccae antigen, or a variant, where the antigen induces an immune response in patients previously exposed to a mycobacterium. Such M. vaccae polypeptides can be used in methods for enhancing non-specific immune response. The methods and products can be used for the detection, treatment and prevention of infectious diseases caused by mycobacteria such as M. vaccae, M. avium or M. tuberculosis. The products also have the ability to induce cell proliferation and cytokine production [e.g. interferon-gamma and interleukin-12 production) in T cells, NX cells. B cells, or macrophages. They can be used for enhancing immune responses for use in vaccines or immunotherapy of infectious diseases and cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mycobacterium vaccae; antigen; therapy; prevention; cytokine production; M. avium; M. tuberculosis; immune response enhancer; cell proliferation; mycobacteria infection; vaccine; cancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mycobacterium vaccae polypeptides - used to develop products for use in detection, therapy and prevention of mycobacteria infections or as immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            M. vaccae antigenic

The gene sequences fall into two classes: (1) X-bomologous DNA which are expressed in many organs, having functional X homologues and (2) testis-specific DNA sequences. Y chromosomal DNA from males with known conditions such as infertility and reduced sperm count can be assessed using the invention to determine whether the condition is associated with or caused by the occurrence of the gene or gene alteration. Candidate inhibitors of the enzymatic activity of the genes can be assessed using in vitro assays

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC electrophoresis using a capillary tube which is at least partly filled CC with a polymer gel. Receptors for target molecules are covalently bound CC to the polymer. An electric field of at least 50 volts/cm is applied. The CC capillary tube is charged with the analytical mixture. In a first CC separation stage, the target molecules in the mixture are bound to the ceptors and the remaining components are eluted, optionally whilst cC splitting open. In a second stage, the elution conditions are changed, contionally in stages, so that the affinity of the target molecules for CC the receptor is eliminated and the target molecules are eluted and CC detected, optionally whilst splitting open. The process is useful for concludes a compounds, contibodies, analysis of antisense compounds or carbohydrates. It may be used, e.g. contibodies, analysis of antisense compounds or screening for enzyme compounds. The process achieves higher resolution and selectivity than constitution of the case of complex biological amounts of complex biological mixtures. It has high sensitivity, even with small amounts of complex biological constitution of constitutions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Best Local Similarity

Introduction of the silyloxymethyl group into the ribonucleoside is simple and rapid, and the acetal bond formed does not migrate, eliminating particularly the prior art problem of 2' to 3' isomerisation. The methylenedioxy group spacer between the silyl group and nucleoside ring results in less steric hindrance than bulky direct silyloxy linkages, enabling first, a range of choices for the silyl substituents, to provide, e.g., acid or base stability; and second, higher yields in coupling. Purer products are therefore obtained than in prior art, enabling larger quantities and longer chains of oligoribonucleotides to be synthesised successfully, and in shorter times
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to silyloxymethyl protected D- or L-ribonucleosides and their phosphonates (I), and silyloxymethyl halides (II). (I) are intermediates for synthesis of RNA-Oligonucleotides with predetermined nucleotide sequence, particularly by machine synthesis. The groups specified above, apart from those on silyl, are those particularly for the sequence of the sequence o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  specified above, apart from those on silyl, are those particularly for the cyanoethyl phosphoramidate coupling. Uses of the oligoribonucleotide products in diagnosis, therapy, and as research tools, are well known, and are not dealt with in detail. (II) is an intermediate for (I). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            dendritic cell maturation; infectious disease; immune disorder; cancer; respiratory system; mycobacterial infection; allergy; tuberculosis; leprosy; sarcoidosis; lung cancer; asthma; skin disorder; psoriasis; dermatitis; eczema; alopecia areata; skin cancer; basal carcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2-Silyloxymethyl ribonucleosides and their phosphonate derivatives - have high purity, use in machine synthesis of ribonucleic acids, enable longer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention provides heat-killed Mycobacterium vaccae, or recombinant CC M. vaccae proteins. The M. vaccae proteins may be employed to activate TC cells and natural killer cells, to stimulate the production of cytokines, to enhance the expression of co-stimulatory molecules on dendritic cells and monocytes, and to enhance dendritic cell maturation and function. The proteins can be expressed by standard recombinant methodology.

CC Pharmaceutical compositions comprising the proteins or nucleic acid sequences encoding the proteins can be used for the treatment, and detection of disorders including infectious diseases, immune disorders and cancer. In particular, the compounds and methods are used for treatment of diseases of the respiratory system, such as mycobacterial infections, asthma, allergies, tuberculosis, leprosy, earcoidosis and lung cancers, and disorders of the skin such as alopecia areata, and skin cancers such as basal carcinoma, squamous cell alopecia areata, and skin cancers such as basal carcinoma, squamous cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

This invention describes a novel method for quantitatively analysing a CC biochemical compound (I) which comprises contacting (I) with double stranded DNA fixed to the surface of an electrode at their terminals in which electrochemically active threading intercalators are intercalated, in an aqueous medium under application of electric potential to the celectrode in the presence of an oxidase which oxidizes the biochemical compound and becomes reduced, and detecting electric current flowing between the electrode and a second electrode in the aqueous medium. The method is useful for detection of biochemical compounds such as glucose, cohlesterol, urea nitrogen, bilirubin, uric acid, haemoglobin and lactic acid in body fluids such as whole blood, plasma, serum, urine, and lymph for diagnosis of various diseases. The method allows detection of biochemical compounds quickly and easily with a high sensitivity using a simple apparatus. This sequence represents DNA fragment used as a target can be considered to the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 transfer between an oxidase and a DNA-immobilized electrode, useful diagnosis of disease.

```

This invention describes a novel method for quantitatively analysing a biochemical compound (I) which comprises contacting (I) with double stranded DNA fixed to the surface of an electrode at their terminals in

Example

Page

7; 14pp;

English

Quantitative analysis of a biochemical compound such as glucose, in a body fluid such as blood, comprising detecting enhanced electron transfer between an oxidase and a DNA-immobilized electrode, useful diagnosis of disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        which electrochemically active threading intercalators are intercalated, in an aqueous medium under application of electric potential to the electrode in the presence of an oxidase which oxidizes the biochemical compound and becomes reduced, and detecting electric current flowing between the electrode and a second electrode in the aqueous medium. The method is useful for detection of biochemical compounds such as glucose, cholesterol, urea nitrogen, bilirubin, uric acid, haemoglobin and lactic acid in body fluids such as whole blood, plasma, serum, urine, and lymph for diagnosis of various diseases. The method allows detection of biochemical compounds quickly and easily with a high sensitivity using a simple apparatus. This sequence represents DNA fragment used as fixed probe DNA in the method of the invention
  administration to a subject. The method comprises: (a) obtaining hasmatopoietic progenitor cells from a donor; and (b) expanding the by adding to the cells a hasmatopoietically effective dose of a polypeptide product having at least part of the primary structural confirmation and one or more of the biological properties of nature.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Stem cell factor; SCF; haematopoietic progenitor cell; blood forming primitive progenitor cell; haematopoietic disorder; syngeneta; allogeneta; autologous bone marrow transplant; gene therapy; transfection; haematopoietic stem cell; acute blood loss; neoplasia;
                                                                                                                                                                                               Example
                                                                                                                                                                                                                                                                             subject

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               occurring stem cell factor (SCF). The method is useful for stimulating primitive progenitor cells including early haematopoletic progenitor cells which are capable of maturing to erythroid, megakaryocyte, granulocyte, lymphocyte and macrophage cells. SCF results in absolute increases in haematopoietic cells of both mysloid and lymphoid lineages. SCF is useful for treating haematopoietic disorders. The method is useful for expanding early haematopoietic progenitors in syngeneic, allogeneic or autologous bone marrow transplant. SCF is useful for enhancing the efficiency of gene therapy based on transfecting haematopoietic stem cells. SCF is also useful for combating the myslosuppressive effects of anti-HIV drugs such as AZT and for enhancing haematopoietic recovery after acute blood loss and as a boost to the immune system for fighting neoplasia (cancer). The present sequence represents a universal oligonucleotide which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                          primitive progenitor cell; haematopoietic disorder; allogeneic; autologous bone marrow transplant; gene transfection; haematopoietic stem cell; acute blood

```

A method has been developed of making haematopoietic administration to a subject. The method comprises: (a) haematopoietic progenitor cells from a donor; and (b) by adding to the cells a haematopoietically effective

(a) obtaining expanding dose of a dose

The method is useful for stimulating committive progenitor cells including early haematopoietic progenitor cells which are capable of maturing to erythroid, megakaryocyte, cells which are capable of maturing to erythroid, megakaryocyte, communicated in absolute cells of both myeloid and lymphoid lineages. SCF is useful for treating haematopoietic disorders. The method is useful cor expanding early haematopoietic grogenitors in syngeneic, allogeneic cor autologous bone marrow transplant. SCF is useful for enhancing the cells. SCF is also useful for combating the myelosuppressive effects of cells. SCF is also useful for combating the myelosuppressive effects of cells. SCF is also useful for combating the myelosuppressive effects of cells. SCF is also useful for combating the myelosuppressive effects of cells. SCF is blood loss and as a boost to the immune system for fighting coplasia (cancer). The present sequence represents a universal correction of the present sequence represents a universal correction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

development of new diagnostic tests, to follow infections, especially viral infections, to follow and/or measure chemical products, especially potential pollutants. In diagnostic tests they may be used as markers, or to form a universal solid phase after immobilization on a solid support, to produce monoclonal antibodies or polyclonal antibodies having diagnostic uses. The oligonuscides AAZ91113-Z91117 represent examples of sequences that can be labeled with the new abietane derivatives. The new derivatives may be used to substitute for biotin in diagnostic tests, but because they are not found naturally in humans the risk of potential

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ್ಷಜ್ಞ
The present sequence is that of a phosphodiester oligonucleotide containing 20 T nucleobases, 19 having a 2'-methoxyethoxy group on its 5' CC containing 20 T nucleobases, 19 having a 2'-methoxyethoxy group on its 5' CC compound stand methods of the invention. The invention provides according to the methods of the invention. The invention provides CC compounds and methods for the preparation of mixed backbone oligomeric, compounds having phosphodiester internucleoside linkages in addition to phosphorothicate and/or phosphoramidate internucleoside continued internucleoside linkages. The methods utilise H-phosphonate intermediates that are coupled together forming contiguous regions of lor more H-cc phosphonate internucleoside linkages. Each contiguous region is subsequently oxidized to phosphodiester, phosphorothicate, phosphoromidate or boranophosphate internucleoside linkages prior to compounds to phosphodiester, phosphorothicate, phosphoromidate or boranophosphate internucleoside linkages prior to compounds of lor more H-group in the great in the manner by oxidizing adjacent regions with different reagents. CC oligomeric compounds of the invention are prepared using novel oxidation steps that oxidize a region of 1 or more H-phosphonate internucleoside linkages without degrading existing linkages that have been previously condized. The oligonucleotides obtained are useful as primers in PCR, cc biological tissue, fluid, cells etc., as research reagents, and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

optimize an immunostimulatory ODN for immune stimulation. Isolated complexes of an immunostimulatory DNA-binding protein bound to an immunostimulatory DNA-binding protein bound to an immunostimulatory ODN can additionally be used to screen a panel of candidate target molecules to identify the cellular target molecules of the immunostimulatory DNA-binding proteins used in the methods of the invention are the RNA-binding proteins nucleolin, harnp D, AUF1, harnp A1 and lupus La protein. The screening methods are useful for identifying a compound that inhibits interaction between immunostimulatory DNA and an immunostimulatory DNA-binding protein and for identifying agonists useful in immunotherapy. The complete useful in screening for immunostimulatory DNA cellular target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunostimulatory oligodeoxynucleotide; immunostimulatory ODN; immunostimulatory DNA-binding protein; nucleolin; hnRNP D; AUF1; hnRNP A1; lupus La protein; functional modifier identification; agonist; antagonist; mimic; inhibitor; drug screening; cellular target identification; oligonucleotide optimisation;
                                                                                                                                                                                                     DNA-binding protein in screening assays to identify compounds which bind to it and thereby act as functional modifiers of immunostimulatory oligodeoxynucleotide (ODN) activity. Such modifiers of DNN activity consist of immunostimulatory DNA binding inhibitors, immunostimulatory DNA adonists and antagonists. Immunostimulatory DNA agonists and antagonists. Immunostimulatory DNA-binding proteins can also be used in screening methods to identify immunostimulatory DNA binding competitors, and to
                                                                                                                                                                                                                                                                                                                                                                                                             Immunostimulatory DNA binding proteins to identify immunostimulatory functional modifiers, immunostimulatory DNA binding competitors and toptimize immunostimulatory oligodeoxynucleotides for stimulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (CPGI-)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 618
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                       The invention relates to the use of an immunostimulatory single-stranded CC DNA-binding protein in screening assays to identify compounds which bind CC to it and thereby act as functional modifiers of immunostimulatory CC oligodeoxynucleotide (ODN) activity. Such modifiers of DNN activity CC onsist of immunostimulatory DNA binding inhibitors, immunostimulatory CC DNA mimics, and immunostimulatory DNA agonists and antagonists.

CC Immunostimulatory DNA-binding proteins can also be used in screening CC methods to identify immunostimulatory DNA binding competitors, and to complexes of an immunostimulatory DNA binding protein bound to an CC complexes of an immunostimulatory DNA-binding protein bound to an CC immunostimulatory DNA can additionally be used to screen a panel of CC candidate target molecules to identify the cellular target molecules of the immunostimulatory DNA-binding proteins concleolin, hnRNP D, AUF, hnRNP Al and lupus La protein. The screening CC mathods are useful for identifying a common that interaction in the methods of the invention are the RNA-binding proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
Best Local :
  The invention relates to the use of an immunostimulatory single-stranded DNA-binding protein in screening assays to identify compounds which bind to it and thereby act as functional modifiers of immunostimulatory oligodeoxynucleotide (DNA) activity. Such modifiers of DNA activity consist of immunostimulatory DNA binding inhibitors, immunostimulatory DNA mimics, and immunostimulatory DNA agonists and antagonists. Immunostimulatory DNA binding proteins can also be used in screening methods to identify immunostimulatory DNA binding competitors, and to optimize an immunostimulatory DNA binding protein bound to an immunostimulatory DNA-binding proteins of the immunostimulatory ODN. The immunostimulatory DNA-binding proteins

                                         The sequence represents a synthetic DNA template molecule used to a demonstrate the method of the invention. The invention relates to a method of modifying (e.g. 3' end labelling with 32P dATP) the 3' terminus of an RNA implecule by providing a DNA oligonucleotide, complimentary to the 3' end of the RNA molecule, with an overhang at the 5' end which allows incorporation of the labeling nucleotide into the RNA molecule. The method, based on the synthesis no describe its useful for labeling and modifying the 3'-termini of other nucleic acids such as DNA fragments. The method is a simple and efficient way of labeling or modifying RNA 3'-termini using DNA polymerase and a synthetic template
                                                                                                                                                                                                                                                                                                                                                                                                     (CHEN/) CHEN G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         used in the methods of the invention are the RNA-binding proteins nucleolin, hnRNP D, AUFI, hnRNP Al and lupus La protein. The screening methods are useful for identifying a compound that inhibits interaction between immunostimulatory DNA and an immunostimulatory DNA-binding protein and for identifying agonists useful in immunotherapy. The completis useful in screening for immunostimulatory DNA cellular target molecules. The candidate immunostimulatory DNN competitors allow the investigation of structure/activity relationships of immunostimulatory DNA-binding proteins and immunostimulatory ODNs. The present sequence represents an oligonucleotide used in an exemplification of the inventic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ψ
                                                                                                                                                                                                                                                      Modifying a 3' terminus of a pre-selected DNA sequence, useful for labeling and modifying 3'-termini of other nucleic acids, comprises a synthetic nucleotide template with a defined overhang nucleotide.
                                                                                                                                                                                                                                                                                                                                                        Huang Z,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δ
                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                    fibronectin, immobilised onto a solid support. The antibody mimics is useful for detecting a compound preferably a protein, in a biological sample. It is also useful to detect one or more different analytes simultaneously in a sample. Hence is useful for diagnostic purposes. It is also useful for the purpose of designing proteins capable of binding to virtually any compound of interest. The present sequence is a capture probe used to self-assemble and anchor the tenth module of human fibronectin module of type III (Fn3) (10Fn3) which is used in an exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to an array of proteins (antibody mimics) comprising a fibronectin type III domain having a randomised loop, a randomised beta-sheet, or their combination, and has the capacity to bind to a compound that is not bound by a corresponding naturally- occurring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fibronectin scaffold protein array for obtaining a protein/compound which binds to a compound/protein, comprises a fibronectin type III domain having a randomized loop, a randomized beta-sheet or their combination.
                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          28-FEB-2001; 2001WO-US006414.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Unidentified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Scaffold protein; antibody mimic; fibronectin type III domain; randomised loop; randomised beta-sheet; diagnostic purpose; protein designing; probe; tenth module of human Fn3; 10Fn3; fibronectin module of type III; Fn3; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Capture probe

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC novel protein kinases. The nucleic acids and the proteins they encode may CC be used in the treatment and diagnosis of diseases associated with CC inappropriate kinase expression such as immune-related diseases and CC disorders, cardiovascular disease, neurodegenerative diseases and/or CC cancers. The nucleic acids and complementary sequences may also be used CC as DNA probes in diagnostic assays. The kinase polypeptides may be used CC as the production of antibodies of kinase expression and CC crivity. Anti-kinase antibodies and kinase expression and CC to down regulate kinase expression and activity. Diseases related to CC kinase expression and activity include rheumatoid arthritis.

CC atherosclerosis, autoimmune disorders, complications of organ CC transplantation, myocardial infarction, immune disorders related CC cardiomyopathies, strokes, renal failure, oxidative stress related CC disorders, chronic inflammatory bowel disease, chronic inflammatory CC pelvic disease, multiple sclerosis, asthana, osteoarthritis, psoriasis, rhinitis auroimmunity disheres

CC molecule to be transported and (B) at least one aryl residue of (A) a CC molecule to be transported and (B) at least one aryl residue of formula - CC Ar-(X-(Y)-R_1) n (II). Ar = group containing at least one aromatic ring; CC X = O or N (Gic); Y = O, S or NH-R_2 (Gic); R_1 = optionally substituted CC 1-22C alkyl (optionally containing double and/or triple bonds); R_2 = CC optionally substituted 1-18C alkyl (optionally containing double and/or triple bonds); R_2 = CC optionally substituted 1-18C alkyl (optionally containing double and/or CC via a chemical group, provided that the chemical group is other than CH_2 CC -S if the bond is via a phosphodiester linkage of (A). The invention also CC describes (I) the preparation of a conjugate (I') of (A') a molecule to CC (III), by preparing (A) containing a reactive function at the position CC and (ii) the use of aryl groups (II) (optionally bonded via a chemical CC group) for transporting (A) across biological membranes. The products of CC the invention have cytostatic, virucide, vasotropic, dermatological, CC antipsoriatic and antischmatic activity and can be used for gene therapy. Conjugation of (A) with (B) is useful for transporting (A) across biological membranes. The products of CC specifically bacterial, yeast or memalaian cells, including human cells, particularly tumor cells). Medicaments, diagnostic agents and test kits CC optionally over alined. Typically (I) are antisense containing (I) are also claimed. Typically (I) are antisense CC labeled oligonucleotides for in vivo diagnostic use, e.g. by in situ cells, particular viral infections or diseases associated with integrins or cell-cell metroscopic monitoring of cellular uptake etc. The cellular uptake of (I), e.g. oligonucleotides for in vivo diagnostic use, e.g. by in situ cells in the copic of cellular uptake etc. The cellular uptake of (I) is superior to that obtained using other conjugated groups related to conjugated using other conjugated groups related to confusionated the cellular uptake etc. 
                                                                                                                                                       В

The invention relates to a method for detection of nucleic acid (I) comparing at least 2 portions, comprising treatment with nanoparticles that carry oligonuclectides complementary to at least 2 parts of (I), where contextable change caused by hybridisation of the oligonuclectide to (I) complementary to at least 2 parts of (I), where complementary to at least 2 parts of (I), where complementary is not least 2 parts of (I), where complementary is not separate) specific (I), complementary and detect of the oligonuclectide to (I) complementary and complementary is not separate) specific (I), complementary and complementary complementary is not separate (I). The computers useful, for example, as biochips, biofilters, mechanical computers, separation membranes, chemical sensors, in computers, and for conjudetes, separation membranes, chemical sensors, in computers, and for conjuded, allowing their direct use (as probes) in polymerase chain comproduced, allowing their direct use (as probes) in polymerase chain computers, and sended after amplification. (I) are detected by simple colour colonge, without the need for special equipment, making possible rapid coligonuclectide-nanoparticle probes, and related sequences, used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  28-MAR-2000; 2000US-0192699P.

The method comprises hybridising the nucleic acid with oligonucleotides, such as the present sequence, attached to a substrate and/or particle and detecting a change in colour, conductivity or optical density. The method is useful for the diagnosis and/or monitoring of diseases, in forensics, in DNA sequencing, for paternity testing, for cell line authentication and for monitoring gene therapy. Detecting nucleic acids based upon observing a colour change is cheap, fast, simple, and does not require specialised or
                                                                                                                                                                                                                                                     change is cheap, fast, simple, and does not require specialised or expensive equipment. The nanoparticle oligonucleotide conjugates restable for at least 6 months. A single base mismatch and as little femtomoles (fM) of target can be detected using the conjugates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting nucleic acid, useful for e.g. diagnosis of diseases, forensics and DNA sequencing, comprises observing detectable change brought about by hybridization of nucleic acid with substrate or particle bound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid detection; nanoparticle-oligonucleotide conjugate; disease diagnosis; forensic analysis; DNA sequencing; paternity testing; cell line authentication; gene therapy; ss.

cc may be coupled with colloidal gold particles (namoparticles) and used to code demonstrate the method of the invention. The invention relates to colloidal gold particle acid of interest, in a mixture of concleic acids, by binding it to 2 or more complimentary nucleotides which have a nanoparticle attached to their 5' ends. The nanoparticles (e.g. colloidal gold) are used to both isolate and detect (e.g. by linking the comparticle to a fluorescent probe) the resultant complex. The methods are cummodified. The methods may also be applied in the diagnosis of genetic, bacterial and viral diseases, in forensics, in DNA sequencing, for cell line authentication, and for monitoring gene cuterapy. The methods are further useful in research and analytical categoristic pathogens, for quick identification of an infection to assist in cut prescription, and in homes and health centres for inexpensive first-cut he naked eye, are cheap, fast, simple, robust (reagents are conting) fast, simple, robust (reagents and little or instrumentation is required
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            attached to nanoparticles and
the nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting a nucleic acid useful in e.g. diagnosing genetic, bacterial or viral diseases, by contacting the nucleic acid with oligonucleotides attached to nanoparticles and having sequences complementary a portion of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nanoparticle; cyclic disulphide-oligonucleotide; DNA detection; DNA isolation; genetic disease; bacterial disease; viral diseas forensic science; paternity testing; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence represents a cyclic disulphide linked oligonucleotide which may be coupled with colloidal gold particles (nanoparticles) and used to

                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a staphylococcus response and continue immune cells. Note: the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or method is staphylococcus), fungal antigens and/or parasitic antigens. The method is staphylococcus)

The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpseviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or stappilus, fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Thi immune response and to activate immune cells. Note: the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (COLE-)

Exposure of SCF to (II) results in increased uptake of (I) into the cell. The method is useful for enhancing the efficiency of the transfer of a polynucleotide into a target mammalian cell in vitro. The method is useful in gene therapy techniques. AAH41301 to AAH41364 and AAB98351 to AAB98390 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enhancing efficiency of transfer of polynucleotide into a target mammalian cell in vitro, involves exposing cell that expresses a stem cell factor receptor to stem cell factor, and introducing polynucleotide into cell in vitro.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20 BP; 0 A; 0 C; 2 G; 18 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for enhancing (E) the efficiency of transfer of a polynucleotide (I) into a target mammalian cell (II) in vitro, comprising exposing (II) that expresses a stem cell factor (SCF) receptor to a biologically active SCF, its analogue or fragment, which induces cell proliferation, and introducing (I) to (II) in vitro. Exposure of SCF to (II) results in increased uptake of (I) into the cell. The method is useful for enhancing the efficiency of the transfer of a polynucleotide into a target mammalian cell in vitro. The method is useful in gene therapy techniques. AAH41301 to AAH41364 and AAB98351 to AAB98390 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enhancing efficiency of transfer of polynuclectide into a target mammalian cell in vitro, involves exposing cell that expresses a stem cell factor receptor to stem cell factor, and introducing polynuclectide into cell in vitro.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method for preparing phosphorothioate oligonucleotides having at least one nucleoside with a 2' modification. The method comprises phosphitylating the 5'-hydroxyl of a nucleic acid group having at least one nucleoside with a 2' modification in an actionitrile. The present sequence was used to illustrate the method of the present invention. The method is useful for synthesising sulphurised 2' substituted phosphorothioate oligonucleotides, which may be used in molecular biological research, in applications such as anti-viral therapy, and for determining the stereochemical pathways of certain enzymes which recognise nucleic acids
The specification describes a method for identifying a nucleic acid in a pool of interest. The method comprises pooling individually identifiable nucleic acids into at least two pools of one nucleic acid each; expressing nucleic acid pools to obtain protein expression product pools; assaying protein expression product pools for products having interaction with target molecule; selecting nucleic acid pools corresponding to identified protein expression product pools; and identifying individual
                                                                                                                                                             Screening nucleic acids (NA) in pool of interest comprises pooling, expressing NA to form expression product pool and identifying NA in NA pool corresponding to expression product pool having interaction with target moiety.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        useful in biological research, comprises phosphitylating the of a nucleic acid having a nucleoside with a 2' modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Preparing sulfurized useful in biological

S-Methythiourea (DNmt) compounds to form triplexes with DNA oligomers. An cincrease in the C content of the oligos resulted in a large decrease in binding. This experiment was performed as an example of a method for preparing oligonucleotides comprising a backbone of alkyl or alkoxy thiourea linkages. The method is useful for preparing oligonucleotides for use in antisense or antigene therapy, to inhibit production of proteins associated with genetic diseases, cardiovascular, inflammatory and neurocellular diseases, and for antiviral therapy, e.g. to treat human immunodeficiency virus, human-cytomegalovirus, influenza and herpes infections. The compounds are also useful as diagnostic reagents to which they specifically bind and by antagonising the normal biological activity of a target protein, they can be used in the manipulation of tissue e.g. tissue differentiation, both in vivo and in ex vivo tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleic acids in identified nucleic acid pools. The method is useful for identifying a nucleic acid (e.g. cDNA) in a pool of interest and for functionally screening several nucleic acids. The method is also useful for screening genomic DNA libraries or other source of individual cDNAs, mRNAs, synthetic libraries of nucleic acids e.g. combinatorial libraries. The present sequence was used in the course of the invention
                                                                                                                                                                                                                                                                                                                          Preparing novel deoxynucleic alkyl thiourea oligonucleotide for use antisense therapy, by synthesizing oligonucleotides comprising backl of alkyl or alkoxy thiourea linkages in solution or on solid phase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Deoxynucleic S-Methythiourea; DNmt; antisense therapy; cardiovascular disease; inflammatory disease; neurocel antiviral therapy; human immunodeficiency virus; human

The present sequence for universal PCR primer 220-11 is 1 of 8 universal CC oligonucleotides (AASO4110-AASO4117) used in the isolation of the human CC SCF (stem cell factor) cDAN sequence. The present invention relates to covel stem cell factors (AAU02453-AAU02458, AAU02460, AAU02461) and the CC including early haematopoietic progenitor cells. The invention also CC including early haematopoietic progenitor cells. The invention also CC (AASO408-AASO4117) used in the isolation of human and rat SCF sequences. CC (AASO408-AASO4117) used in the isolation of human and rat SCF sequences. CC (CC The polynucleotide encoding SCF is useful for producing SCF and useful in CC gene therapy. It is useful for treating disorders involving blood cells such as myelotibrosis, metastatic carcinoma, acute leukaemia, multiple CC myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, CC congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, CC disseminated fungus disease, Fulminating septicemia, malaria, vitamin B12 cand folic acid deficiency, pyridoxine deficiency, and hypopigmentation CC disorders such as piebaldism and vitiligo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SXS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SΧ
        The present sequence for universal PCR primer 220-3 is 1 of 8 universal CC oligonucleotides (AAS04110-AAS04117) used in the isolation of the human CC SCF (stem cell factor) CDNA sequence. The present invention relates to CC novel stem cell factors (AAU02453-AAU02458, AAU02460) and the CC polynucleotides encoding them. SCF stimulate primitive progenitor cells CC including early haematopoietic progenitor cells. The invention also CC describes SCF peptides (AAU02461-AAU02481) and the oligonucleotides (CC (AAS04081-AAS04117) used in the isolation of human and rat SCF sequences. CC The polynucleotide encoding SCF is useful for producing SCF and useful in CC gene therapy. It is useful for treating disorders involving blood cells CC such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple CC myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, CC congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, CC disseminated fungus disease, Fulminating septicemia, malaria, vitamin B12 cand folic acid deficiency, pyridoxine deficiency, and hypopigmentation CC disorders such as piebaldism and vitiligo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                               The present invention provides the protein and coding sequences of mammalian stem call factors (SCFs). These are capable of stimulating the growth of early haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The sequences are useful in the treatment of leukaemias, haematopoietic disorders, aplastic anaemia, paroxysmal nocturnal haemoglobinuria, malaria, pigmentation disorders, neurological and intestinal damage, infertility, AIDS and severe combined immunodeficiency (SCID). The present sequence is primer used to amplify an SCF in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               11-JUN-1990;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of mammalian stem cell factors (SCFs). These are capable of stimulating the growth of early haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The sequences are useful in the treatment of leukaemias, haematopoietic disorders, aplastic anaemia, paroxysmal nocturnal haemoglobinuria, malaria, pigmentation disorders, neurological and intestinal damage, infertility, AIDS and severe combined immunodeficiency (SCID). The present sequence is primer used to amplify an SCF in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated non-human mammalian stem cell factor polypeptide stimulating growth of early hematopoietic progenitor cells, useful for treating aplastic anemia, lymphoma, Letterer-Siwe disease, Kala azar,
  Human SCF (stem cell factor) cDNA universal PCR primer 220-3.

The present invention relates to covel stem cell factors (AAB73561-AAB73563) and the CC novel stem cell factors (AAB73561-AAB73563) and the CC including early haematopoietic progenitor cells. The invention also cells cover cover cover cover cover cover cover cover cover cells. The invention also cells cover cells cover cells cover cells cover cells.
